

What is Content Blocks?

A visual way to form content hierarchy for any web project or application.

Block Types

There are 2 types of content blocks:

Focus Points

Focus Points are the types of content that are most important to you. They are area's of content that you are trying to draw the user to over the rest of the website or app.

Content Blocks

Content blocks are the opposite. These are the blocks that make up the bulk of the content and are not as important as focus points.

Content Structure

Each block has a place to put multiple CTA's (Call to Action's) and basic information to label the block of content it represents. There are also 2 indicators that represent "The Fold" and "The Footer".

Each content block can be moved by dragging the 6 dots on the left to rearrange them in the order you need.
